

Health. <More-connected.>

Afia Analytics

Afia Analytics goes beyond dashboards to create business intelligence. Better outcomes. Improved productivity. Empowered staff.

Afia Analytics Productivity Package

The Process

Data is extracted from your source systems, including the Electronic Health Record. The data is transformed into meaningful tables and fields within a Data Warehouse for analytics use. The Data Warehouse that results from this process is used to calculate the Productivity Metric for the organization.

Maximize Your Analytics Platform

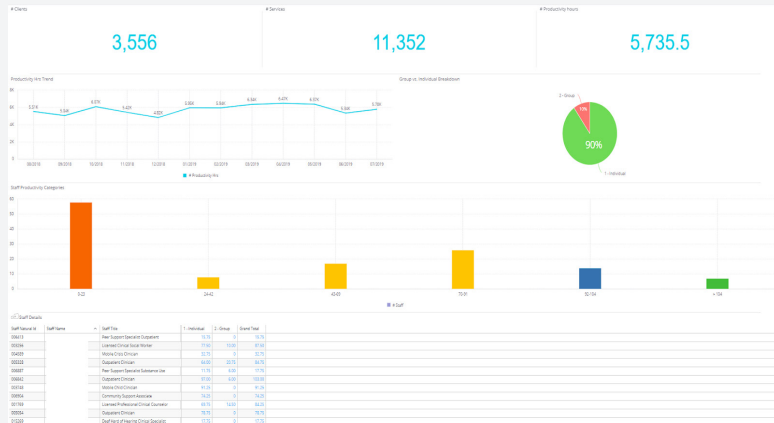

The Productivity Metrics are provided to your organization in easy-to-use business intelligence dashboards, complete with drill-down capabilities and useful data filters. "Pulses" can also be created to inform staff when data reaches specific levels in order to increase awareness and visibility of important performance levels per metric. Organizations with an Afia Analytics designer license can be trained on the data model as well, so they can extend the system with their own custom dashboards.

Create a Data-Driven Culture

Baseline Values and Target Goals for each metric are defined based on organization input and industry standards. Afia Subject Matter Experts help identify root causes, recommend process improvements, provide training, and monitor metric performance.
